EXPERIMENT No.4

Aim: To install Kubectl and execute Kubectl commands to manage the Kubernetes cluster and deploy Your First Kubernetes Application.

Steps:

1. Select Amazon linux as OS image or use any but change the setting acc to it:

2. Make ssh connection in terminal or in browser:

3. Install Docker

Use below commands and enable and test docker;

sudo dnf update sudo dnf install docker sudo systemctl enable docker sudo systemctl start docker

```
[ec2-user@ip-172-31-24-190 ~]$ sudo docker run hello-world
Unable to find image 'hello-world:latest' locally
latest: Pulling from library/hello-world
c1ec31eb5944: Pull complete
Digest: sha256:91fb4b041da273d5a3273b6d587d62d518300a6ad268b28628f74997b93171b2
Status: Downloaded newer image for hello-world:latest
Hello from Docker!
This message shows that your installation appears to be working correctly.
```

4. Install Kubernetes

Install CNI plugins:

CNI_PLUGINS_VERSION="v1.3.0"
ARCH="amd64"
DEST="/opt/cni/bin"
sudo mkdir -p "\$DEST"
curl -L

"https://github.com/containernetworking/plugins/releases/download/\${CNI_PLUGINS_ VERSION}/cni-plugins-linux-\${ARCH}-\${CNI_PLUGINS_VERSION}.tgz" | sudo tar -C "\$DEST" -xz

Define the directory to download command files:

DOWNLOAD_DIR="/usr/local/bin" sudo mkdir -p "\$DOWNLOAD_DIR"

Optionally install crictl (required for interaction with the Container Runtime Interface (CRI), optional for kubeadm):

CRICTL_VERSION="v1.31.0" ARCH="amd64" curl -L

"https://github.com/kubernetes-sigs/cri-tools/releases/download/\${CRICTL_VERSION}/crictl-\${CRICTL_VERSION}-linux-\${ARCH}.tar.gz" | sudo tar -C \$DOWNLOAD_DIR -xz

Install kubeadm, kubelet and add a kubelet systemd service:

RELEASE="\$(curl -sSL https://dl.k8s.io/release/stable.txt)"
ARCH="amd64"
cd \$DOWNLOAD_DIR
sudo curl -L --remote-name-all
https://dl.k8s.io/release/\${RELEASE}/bin/linux/\${ARCH}/{kubeadm,kubelet}
sudo chmod +x {kubeadm,kubelet}

RELEASE_VERSION="v0.16.2"

curl -sSL

"https://raw.githubusercontent.com/kubernetes/release/\${RELEASE_VERSION}/cmd/kr el/templates/latest/kubelet/kubelet.service" | sed "s:/usr/bin:\${DOWNLOAD_DIR}:g" | sudo tee /usr/lib/systemd/system/kubelet.service sudo mkdir -p /usr/lib/systemd/system/kubelet.service.d curl -sSL

"https://raw.githubusercontent.com/kubernetes/release/\${RELEASE_VERSION}/cmd/krel/templates/latest/kubeadm/10-kubeadm.conf" | sed "s:/usr/bin:\${DOWNLOAD_DIR}:g" | sudo tee /usr/lib/systemd/system/kubelet.service.d/10-kubeadm.conf

Now we need to install kubectl

Set up repository:

cat <<EOF | sudo tee /etc/yum.repos.d/kubernetes.repo
[kubernetes]
name=Kubernetes
baseurl=https://pkgs.k8s.io/core:/stable:/v1.31/rpm/
enabled=1
gpgcheck=1
gpgkey=https://pkgs.k8s.io/core:/stable:/v1.31/rpm/repodata/repomd.xml.key
EOF

sudo yum install -y kubectl

ec2-user@ip-172-31-24-190 ~ \$ kubectl version Client Version: v1.31.1 Kustomize Version: v5.4.2

We have installed successfully installed kubernetes

After installing Kubernetes, we need to configure internet options to allow bridging.

sudo swapoff -a echo "net.bridge.bridge-nf-call-iptables=1" | sudo tee -a /etc/sysctl.conf sudo sysctl -p

```
[root@ip-172-31-24-190 bin]# sudo swapoff -a
echo "net.bridge.bridge-nf-call-iptables=1" | sudo tee -a /etc/sysctl.conf
sudo sysctl -p
net.bridge.bridge-nf-call-iptables=1
net.bridge.bridge-nf-call-iptables = 1
```

Disable SELINUX

Type **sudo nano /etc/selinux/config** and set the value of **SELINUX=disabled** instead of **SELINUX=permissive**

Save the file by pressing ctrl+o then press enter then press ctrl+x

```
This file controls the state of SELinux on the system.
 SELINUX= can take one of these three values:
     enforcing - SELinux security policy is enforced.
     permissive - SELinux prints warnings instead of enforcing.
     disabled - No SELinux policy is loaded.
 https://docs.fedoraproject.org/en-US/quick-docs/getting-started-with-selinux/#getting-started-with-selinux-selinux-states-and-modes
 NOTE: In earlier Fedora kernel builds, SELINUX=disabled would also
 need to pass selinux=0 to the kernel command line. You can use grubby
   grubby --update-kernel ALL --args selinux=0
 To revert back to SELinux enabled:
    grubby --update-kernel ALL --remove-args selinux
SELINUX=disabled
 SELINUXTYPE= can take one of these three values:
     targeted - Targeted processes are protected,
     minimum - Modification of targeted policy. Only selected processes are protected.
     mls - Multi Level Security protection.
SELINUXTYPE=targeted
```

Then reboot the system using sudo reboot

After rebooting we need to make ssh connection with machine after it gets disconnected

Now if we type command sestatus, then it show disabled

```
ec2-user@ip-172-31-24-190 ~ $ sestatus
SELinux status: ____ disabled
```

5. Initialize the Kubecluster

Install packages socat and iproute-tc and conntrack to avoid prelight errors sudo dnf install socat iproute-tc conntrack-tools -y

sudo kubeadm init --pod-network-cidr=10.244.0.0/16

```
Your Kubernetes control-plane has initialized successfully!

To start using your cluster, you need to run the following as a regular user:

mkdir -p $HOME/.kube
sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config
sudo chown $(id -u):$(id -g) $HOME/.kube/config

Alternatively, if you are the root user, you can run:

export KUBECONFIG=/etc/kubernetes/admin.conf

You should now deploy a pod network to the cluster.

Run "kubectl apply -f [podnetwork].yaml" with one of the options listed at:
    https://kubernetes.io/docs/concepts/cluster-administration/addons/

Then you can join any number of worker nodes by running the following on each as root:

kubeadm join 172.31.24.190:6443 --token xsbsq1.6ro11sawnvttbsvu \
    --discovery-token-ca-cert-hash sha256:10d2b67f4f4749b51854065a554c74e6a956e4782d9ab4bb79b8591648b3edef
ec2-user@ip-172-31-24-190 ~ $ kubectl get nodes
```

Copy the mkdir and chown commands from the top and execute them

mkdir -p \$HOME/.kube sudo cp -i /etc/kubernetes/admin.conf \$HOME/.kube/config sudo chown \$(id -u):\$(id -g) \$HOME/.kube/config

sudo systemctl restart kubelet

Then, add a common networking plugin called flannel as mentioned in the code. kubectl apply -f

https://raw.githubusercontent.com/coreos/flannel/master/Documentation/kube-flanne l.yml

```
ec2-user@ip-172-31-24-190 ~ $ kubectl apply -f https://raw.githubusercontent.com/coreos/flannel/master/Documentation/kube-flannel.yml
namespace/kube-flannel created
clusterrole.rbac.authorization.k8s.io/flannel created
clusterrolebinding.rbac.authorization.k8s.io/flannel created
serviceaccount/flannel created
configmap/kube-flannel-created
daemonset.apps/kube-flannel-ds_created
```

Now type kubectl get nodes

```
The connection to the server 172.31.24.190:6443 was refused - did you specify the right host or port?
ec2-user@ip-172-31-24-190 ~ $ kubectl get nodes
The connection to the server 172.31.24.190:6443 was refused - did you specify the right host or port?
ec2-user@ip-172-31-24-190 ~ $ kubectl get nodes
^[[AError from server (Forbidden): nodes is forbidden: User "kubernetes-admin" cannot list resou<u>rce "nodes" in</u>
ec2-user@ip-172-31-24-190 ~ $ kubectl get nodes
                               STATUS ROLES
                                                        AGE
                                                              VERSION
ip-172-31-24-190.ec2.internal Ready
                                        control-plane
                                                      34m
                                                             v1.31.0
ec2-user@ip-172-31-24-190 ~ $ kubectl get nodes
                               STATUS ROLES
                                                        AGE
                                                              VERSION
ip-172-31-24-190.ec2.internal
                                        control-plane
                                                              v1.31.0
                               Ready
                                                       34m
ec2-user@ip-172-31-24-190 ~ $
```

Now that the cluster is up and running, we can deploy our nginx server on this cluster. Apply this deployment file using this command to create a deployment

```
ec2-user@ip-172-31-24-190 ~ $ kubectl apply -f https://k8s.io/examples/application/deployment.yaml deployment.apps/nginx-deployment created
```

Use 'kubectl get pods' to verify if the deployment was properly created and the pod is working correctly.

```
ec2-user@ip-172-31-24-190 ~ $ kubectl get pods
NAME
                                    READY
                                             STATUS
                                                       RESTARTS
                                                                   AGE
nginx-deployment-d556bf558-mwd8p
                                    0/1
                                             Pending
                                                       0
                                                                   7s
nginx-deployment-d556bf558-zc25s
                                    0/1
                                             Pending
                                                       0
                                                                   7s
```

As we can see our pods are in pending state

On checking logs to we came to know the pods are in tainted state (using command **kubectl describe pod nginx-deployment-d556bf558-mwd8p**)

To make pods untainted

Type kubectl get nodes to see name of node

```
ec2-user@ip-172-31-24-190 ~ $ kubectl get nodes

NAME STATUS ROLES AGE VERSION

ip-172-31-24-190.ec2.internal Ready control-plane 43m v1.31.0

ec2-user@ip-172-31-24-190 ~ $ | |
3     1:ec2-user@ip-172-31-24-190:~* 2:~/Downloads- 3:~/Downloads# 4:~/Downloads
```

Copy the name of the node (ip-172-31-24-190.ec2.internal)

Then type command **kubectl taint nodes <NODE_NAME> - -all**

In my case **kubectl taint nodes ip-172-31-24-190.ec2.internal node-role.kubernetes.io/control-plane-**

```
ec2-user@ip-172-31-24-190 ~ $ kubectl taint nodes ip-172-31-24-190.ec2.internal node-role.kubernetes.io/control-plane-
node/ip-172-31-24-190.ec2.internal untainted
```

After executing above command, check again status of pods if still pending then restart kubelet wait for 1-2 minutes and check again

```
ec2-user@ip-172-31-24-190 ~ $ kubectl get pods
NAME
                                    READY
                                            STATUS
                                                       RESTARTS
                                                                     AGE
nginx-deployment-d556bf558-mwd8p
                                    1/1
                                            Running
                                                       2 (73s ago)
                                                                     12m
nginx-deployment-d556bf558-zc25s
                                    1/1
                                            Running
                                                       2 (73s ago)
                                                                     12m
```

As we can see our pods are running

Lastly, port forward the deployment to your localhost so that you can view it.

kubectl port-forward <POD_NAME> 8080:80

In my case: kubectl port-forward nginx-deployment-d556bf558-mwd8p 8080:80

Note: if you are getting connection refused error then restart kubelet

```
ec2-user@ip-172-31-24-190 ~ $ kubectl port-forward nginx-deployment-d556bf558-mwd8p 8080:80
Forwarding from 127.0.0.1:8080 -> 80
Forwarding from [::1]:8080 -> 80
```

As port forwarding is active so we cannot type other commands.

Open new terminal window and make ssh connection to same machine OR we can open instance of same machine in new browser tab

And type command **curl --head http://127.0.0.1:8080**

Response status 200 (OK) indicates that our nginx server is running successfully on kubernetes

Conclusion: We started with the installation and configuration of Docker and Kubernetes. Initially, the Kubernetes API server encountered some problems, but these were fixed by restarting the kubelet service. The pods we created were not running because the nodes had taints, so we had to remove those taints. After addressing all the issues, the NGINX server pods were successfully deployed and made accessible through port forwarding. The NGINX server can now be accessed from different terminals or by running the port-forward command in the background using an '&' at the end of the command.
